9674 1952 marlon wallace .Q: "If you like, move your cursor" - can I use "this way"? I was listening to a recording of a speech given by an American president. It was said in this context: "We'll put you into a position that will be clear to the watching world. If you like, move your cursor somewhere else." Does it mean "if you like, leave this place". Or just "If you like, move your cursor". A: Your example, "... if you like, move your cursor somewhere else.", doesn't sound quite right, since movement is usually relative, i.e. "I like to move my cursor". In any case, if you are talking about moving your cursor by some kind of remote control, I think the most natural thing to say would be, "Move the cursor to wherever you like". Oxidation of PS model membranes and LDL by lysophospholipase II of Pseudomonas aeruginosa: a biosensory function? The extracellular lysophospholipase II of Pseudomonas aeruginosa is a surface enzyme mediating degradation of the phospholipid-based target molecule lipopolysaccharide. To test the hypothesis that lipolytic activity of the enzyme is due to a large part to oxidation of the main alkyl chains, we have analyzed the action of the enzyme on various PS model membranes and on the LDL surface. We show that lysophospholipase II oxidizes the PS membranes only when present as a monolayer, and that the oxidized form is present exclusively in the fluid-expanded state. Addition of the reducing agent ascorbic acid diminished the oxidized form of PS and significantly decreased the activity of the lysophospholipase II. Addition of 5, 5'-dithiobis-2-nitrobenzoic acid to the oxidized PS containing membranes blocked the oxidase reaction. The lipid-oxidizing function of the lysophospholipase II of P. aeruginosa requires an intact Fe(III)-binding site on the protein. We suggest that oxidation of PS membrane lipids underlies a biosensory function of the enzyme, in which soluble oxidants produced by the bacterial cell wall can be detected by the extracellular lysoph 6d1f23a050
