A component that allows a GameObjectThe fundamental object in Unity scenes, which can represent characters, props, scenery, cameras, waypoints, and more. A GameObjects functionality is defined by the Components attached to it. More info See in Glossary to be affected by simulated gravity and other forces. More info A physics component allowing a dynamic connection between Rigidbody components, usually allowing some degree of movement such as a hinge. More info See in Glossary type that connects two RigidbodyA component that allows a GameObject to be affected by simulated gravity and other forces. More info See in Glossary components together but allows the distance between them to change as though they were connected by a spring. More info A jointA physics component allowing a dynamic connection between Rigidbody components, usually allowing some degree of movement such as a hinge. More info See in Glossary type that connects two RigidbodyA component that allows a GameObject to be affected by simulated gravity and other forces. More info See in Glossary components together but allows the distance between them to change as though they were connected by a spring. More info A system that simulates aspects of physical systems so that objects can accelerate correctly and be affected by collisionsA collision occurs when the physics engine detects that the colliders of two GameObjects make contact or overlap, when at least one has a Rigidbody component and is in motion. More info See in Glossary, gravity and other forces. More info
